Healthier life for Eco-Innovative Components for housing Construction

GOALS AND OBJECTIVE

- Innovative materials and construction
- Improved Indoor Environmental Quality
 - Thermal comfort
 - RH – Water vapour sorption
 - Prevention against overheating in summer
 - Low emitting materials
 - Adsorption of air pollutants
 - Sound insulation
- LCA / LCC
- Energy efficiency
- Affordability

and acoustic

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Address shortcomings associated with modern airtight buildings

- > increased relative humidity levels indoors, damp problems and condensation
- > higher concentration of air pollutants

Develop robust solutions that are able to react to reduced air exchange rates and address associated problems in combination with natural ventilation.

Mould growth

Materials emissions

Evaporations

Comparison : Humidity adsorption of earthen and cementitious plasters

Earthen plaster

Ad-and desorption in 24 h

Cementitious plaster

Time [h]

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Aerogel (silicate based) highly porous solid objects (ND / CMS / E9)

Bulk density between 40-150 kg/m³, surface area 750 m² / g

Very cost efficient material production

Material development so far achieved TRL 5, Demonstration is anticipated

Tested against DIN 18947 (earth plasters) strength + shrinkage, new standard required

Flow diameter

Drying shrinkage

Compressive strength

Microscopy

Healthier life for Eco-Innovative Components for housing Construction

Water vapour adsorption [g/m²]

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Water Vapour Sorption Tests (DIN 18947) +
Emission tests (ISO 16000-9 | prEN 16516)

Earth plaster

Earth dry, earth cellulose board

Wood fibre, wood fibre sandwich board

Wood fibre, hemp and clothes insulation

Wood fibre flax board or strawboard

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Wall build-ups

Wall build-up: Earth plaster rough (straw) + Earth adhesive + Pavaboard + Pavaflex

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Material investigation – water vapour sorption test (based on DIN 18947)

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Material emissions and reduction of airborne pollutants

1. Emissions testing

- Emissions of formaldehyde, VOCs, SVOCs and radon by sampling at days 3, 7, 10 and 28 days after loading
- Evaluation against German AgBB testing scheme

2. Testing for adsorption capacity

- Sorption behaviour towards 5 VOCs representing important indoor air pollutants (1- pentanol, hexanal, butyl acetate, α -pinene and n-decane)
- Concentrations ranging from 200 to 500 $\mu\text{g}/\text{m}^3$

3. Testing parameters for both types of testing

- $T = 23\text{ }^{\circ}\text{C}$ / $\text{RH} = 50\%$
- $n = 1.0\text{ h}^{-1}$ / $L = 2.0\text{ m}^2/\text{m}^3 \rightarrow q = 0.5\text{ m}^3/(\text{m}^2\text{h})$
- Corresponds to a reference room of 30 m^3 (3 m x 4 m x 2,5 m) with a wall surface area of 31.4 m^2 (European reference room)

Material emissions and reduction of airborne pollutants

Preparation of test samples and testing

1. Installation into modular sample intakes

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Material emissions and reduction of airborne pollutants

Preparation of test samples and testing

2. Pre-conditioning of test samples, if necessary $n = 1,0 \text{ h}^{-1}$, $\text{RH} = 50 \%$
3. Assembling emission test chamber

1. Glass lid with agitator
2. Connection ring

3. Hollow cylinder
4. Sample intake

Material emissions and reduction of airborne pollutants

Evaluation of (s)VOC emissions

Fig. 1: Flow chart for the evaluation of VOC* and SVOC* emissions from building products

- Evaluation of suitability for indoor use
 - In Germany mandatory for flooring materials and decorative wall coverings
 - Developed for evaluation of VOC emissions from single building materials
- ➔ In the H-House project used to assess emissions into indoor air

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Material emissions and reduction of airborne pollutants

Evaluation of VOC reduction (ISO 16000-24:2009)

1. Determination of sorption flux F_m [$\mu\text{g}/(\text{m}^2\text{h})$]
Mass of VOC (except formaldehyde) sorbed per time per area at the specified elapsed time from the test start
2. Calculation of sorption mass pA_a [$\mu\text{g}/\text{m}^2$]
Theoretical maximum mass of VOC (except formaldehyde) that could be removed per area of the sorptive material
3. Test stopped when half-lifetime was reached for each compound
Time elapsed from the start of the test until the VOC decreases to one-half of the initial concentration.
4. Measurement of re-release of VOCs for at least 7 days

Healthier life for Eco-Innovative Components for housing Construction

Material emissions and reduction of airborne pollutants

Results of emissions tests

VOC

- TVOC in all cases below 1000 $\mu\text{g}/\text{m}^3$
- AgBB criteria fulfilled in 18 from 19 cases

Limitation: Evaluation scheme developed for single materials! For application on composite materials criteria would need to be adjusted.

Radon

Radon exhalation from all tested materials fell below the recommended contribution to the overall indoor radon concentration of 20 Bq/m³

(recommendation German Committee for Radiation Protection)

- In most cases near or below limit of detection

6	6.6	4.2	11.0	0.0	0.0	21.8
7	6.0	1.9	1.8	0.0	0.8	10.5
8	36.3	32.2	57.1	0.0	0.9	> 126.5
9	9	2.3	11.9	0.0	1.7	24.9

- Earth plaster materials generally show good adsorption capacity
- Significant increase of adsorption when ND *Aerogel powder hydrophilic* (ND_{PI}) or CMS *Aerogel Granulate hydrophilic* (CMS_{GI}) was added
- Adsorption generally favourable to the polar VOCs and n-decane in low amounts;
- α -pinene was not attached
- Plaster thickness important – best performance at 5-10 mm

Timber Earth Buildings

Energy efficient without mech. ventilation

Monitoring results of flats fitted out with earth plasters

Bathroom in wintertime

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Conclusions

- Earth, timber, wood- and other natural fibres are vapour active and able control the indoor climate / humidity and temperature
- These natural building materials demonstrate very low emissions and earthen plasters are able to absorb VOC from the indoor air
- The addition of aerogels the moisture adsorption and air purifying capacity of earthen plaster was enhanced fossil society

[H] house – EU RESEARCH PROJECT

Healthier life for Eco-Innovative Components for housing Construction

Conclusions

- Energy efficient, airtight buildings, naturally ventilated twice a day demonstrate healthy RH between 40% - 60%
- In the moderate central climate (Europe) Low-Tech zero carbon buildings can be constructed without or significantly reduced mechanical ventilation
- This Low-Tech approach can also be applied for the usually high mechanical ventilated and conditioned office building sector and production buildings
- In hot dry climatic zones specially earth has a huge cooling and low-cost potential
- Based on further R&D natural materials are based for Low-Tech pioneers of the post
